ABSTRACT OF THE DISCLOSURE

A thermally conductive polymer composition includes polymer matrix such as thermoplastic resin or 5 thermoplastic elastomer and a graphitized carbon fiber which serves as a thermally conductive filler. The graphitized carbon fiber is made from a mesophase pitch. The mesophase pitch is spun, infusibilized, carbonized, pulverized, and graphitized to form powdery graphitized 10 carbon fibers. Preferably, the graphitized carbon fibers have a diameter of $5-20\mu m$, an average particle size of 10- $500\mu\text{m}$, and a density of $2.20-2.26\text{g/cm}^3$. The composition may be molded to form a thermally conductive molded article such as a thermally conductive sheet. The 15 thermally conductive polymer composition and thermally conductive molded article have high thermal conductivity and transfer large amounts of heat from electric or electronic parts.
